

THE GREEN NETWORK

A green network is a system of pedestrian and bicycle trails, parks, stream corridors, wetlands, natural areas, and green streets that enhance water quality, accessibility, safety, and connectors to the natural environment throughout the subarea. With stormwater management, creek corridor enhancement, and protection of wildlife habitat, the green network would provide many environmental benefits. See anticipated possibilities and opportunities below and on adjacent display.

Protected wetlands and wildlife habitat

Preservation of existing trees to be encouraged

Enhanced stream corridors
